The 747 Primary Flight Control Systems Reliability and Maintenance Study

Reliability Based Aircraft Maintenance Optimization and Applications presents flexible and cost-effective maintenance schedules for aircraft structures, particular in composite airframes. By applying an intelligent rating system, and the back-propagation network (BPN) method and FTA technique, a new approach was created to assist users in determining inspection intervals for new aircraft structures, especially in composite structures. This book also discusses the influence of Structure Health Monitoring (SHM) on scheduled maintenance. An integrated logic diagram establishes how to incorporate SHM into the current MSG-3 structural analysis that is based on four maintenance scenarios with gradual increasing maturity levels of SHM. The inspection intervals and the repair thresholds are adjusted according to different combinations of SHM tasks and scheduled maintenance. This book provides a practical means for aircraft manufacturers and operators to consider the feasibility of SHM by examining labor work reduction, structural reliability variation, and maintenance cost savings. Presents the first resource available on airframe maintenance optimization Includes the most advanced methods and technologies of maintenance engineering analysis, including first application of composite structure maintenance engineering analysis integrated with SHM Provides the latest research results of composite structure maintenance and health monitoring systems

To be able to compete successfully both at national and international levels, production systems and equipment must perform at levels not even thinkable a decade ago. Requirements for increased product quality, reduced throughput time and enhanced operating effectiveness within a rapidly changing customer demand environment continue to demand a high maintenance performance. In some cases, maintenance is required to increase operational effectiveness and revenues and customer satisfaction while reducing capital, operating and support costs. This may be the largest challenge facing production enterprises these days. For this, maintenance strategy is required to be aligned with the production logistics and also to keep updated with the current best practices. Maintenance has become a multidisciplinary activity and one may come across situations in which maintenance is the responsibility of people whose training is not engineering. This handbook aims to assist at different levels of understanding whether the manager is an engineer, a production manager, an experienced maintenance practitioner or a beginner. Topics selected to be included in this handbook cover a wide range of issues in the area of maintenance management and engineering to cater for all those interested in maintenance whether practitioners or researchers. This handbook is divided into 6 parts and contains 26 chapters covering a wide range of topics related to maintenance management and engineering.

Plane Sense, General Aviation Information, 2008

Civil Aviation: Standards and Liabilities examines operational standards and obligations and investigates the consequences of failure to comply with them, utilising source material from major treaties such as the Chicago Convention on Civil Aviation 1944 and its key ICAO Annexes, including: SARPS (Standards and Recommended Practices), PANS (Procedures for Air Navigation Services), SUPPS (Regional Supplementary Procedures), Air Traffic Services, Rules of the Air, Aircraft Accident Investigation, Airworthiness of Aircraft, and Aeronautical Telecommunications. Key features of the ICAO Convention signed at Montreal in 1999, including carrier liability for passenger bodily injury or death, are also considered. Civil Aviation: Standards and Liabilities also examines the changing nature of civil aviation in Europe and highlights the advent of the Joint Aviation Authority (JAA) and the increasing application of the Joint Aviation Requirements (JARs), paying particular attention to their effect upon flight crew training procedures. The book also investigates topics found in international aviation litigation as well as Risk Management, Aviation Insurance and Product Liability.

A Collection of Technical Papers

Many of the aircraft that form the backbone of the U.S. Air Force operational fleet are 25 years old or older. A few of these will be replaced with new aircraft, but many are expected to remain in service an additional 25 years or more. This book provides a strategy to address the technical needs and priorities associated with the Air Force's aging airframe structures. It includes a detailed summary of the structural status of the aging force, identification of key technical issues, recommendations for near-term engineering and management actions, and prioritized near-term and long-term research recommendations.

RCM was developed in the 1970s and is today recognized as critical to success in tackling problems of maintenance costs, increased competition on quality and environmental and safety requirements. This book is designed for those involved in productivity and maintenance training.

Safety Recommendation

In this book the authors provide a fresh look at basic reliability and maintainability engineering techniques and management tools for application to the system maintenance planning and implementation process. The essential life-cycle reliability centered maintenance (ReM) activities are focused on maintenance planning and the prevention of failure. The premise is that more efficient, and therefore effective, life-cycle maintenance programs can be established using a well disciplined decision logic analysis process that addresses individual part failure modes, their consequences, and the actual preventive maintenance tasks. This premise and the techniques and tools described emphasize preventive, not corrective, maintenance. The authors also describe the techniques and tools fundamental to maintenance engineering. They provide an understanding of the inter relationships of the elements of a complete ReM program (which are applicable to any complex system or component and are not limited only to the aircraft industry). They describe special methodologies for improving the maintenance process. These include an on-condition maintenance (OeM) methodology to identify defects and potential deterioration which can determine what is needed as a maintenance action in order to prevent failure during use.

Lok Sabha Debates

This book explains basic concepts, principles, definitions, and applications of a logical discipline for development of efficient scheduled (preventive) maintenance programs for complex equipment, and the on-going management of such programs. Such programs are called reliability-centered maintenance (RCM) programs because they are centered on achieving the inherent safety and reliability capabilities of equipment at a minimum cost. A U.S. Department of Defense objective in sponsoring preparation of this document was that it serve as

a guide for application to a wide range of different types of military equipment. There are essentially only four types of tasks in a scheduled maintenance program: (1) Inspect an item to detect a potential failure; (2) Rework an item before a maximum permissible age is exceeded; (3) Discard an item before a maximum permissible age is exceeded; (4) Inspect an item to find failures that have already occurred but were not evident to the equipment operating crew. A central problem addressed in this book is how to determine which types of scheduled maintenance tasks, if any, should be applied to an item and how frequently assigned tasks should be accomplished. The use of a decision diagram as an aid in this analysis is illustrated. The net result is a structured, systematic blend of experience, judgment, and operational data/ information to identify and analyze which type of maintenance task is both applicable and effective for each significant item as it relates to a particular type of equipment.

Reliability Based Aircraft Maintenance Optimization and Applications

The major objective of this book was to identify issues related to the introduction of new materials and the effects that advanced materials will have on the durability and technical risk of future civil aircraft throughout their service life. The committee investigated the new materials and structural concepts that are likely to be incorporated into next generation commercial aircraft and the factors influencing application decisions. Based on these predictions, the committee attempted to identify the design, characterization, monitoring, and maintenance issues that are critical for the introduction of advanced materials and structural concepts into future aircraft.

Aircraft maintenance, repair and overhaul (MRO) requires unique information technology to meet the challenges set by today's aviation industry. How do IT services relate to aircraft MRO, and how may IT be leveraged in the future? Leveraging Information Technology for Optimal Aircraft Maintenance, Repair and Overhaul (MRO) responds to these questions, and describes the background of current trends in the industry, where airlines are tending to retain aircraft longer on the one hand, and rapidly introducing new genres of aircraft such as the A380 and B787, on the other. This book provides industry professionals and students of aviation MRO with the necessary principles, approaches and tools to respond effectively and efficiently to the constant development of new technologies, both in general and within the aviation MRO profession. This book is designed as a primer on IT services for aircraft engineering professionals and a handbook for IT professionals servicing this niche industry, highlighting the unique information requirements for aviation MRO and delving into detailed aspects of information needs from within the industry. Provides practical and realistic solutions to real-world problems Presents a global perspective of the industry and its relationship with dynamic information technology Written by a highly knowledgeable and hands on practitioner in this niche field of Aircraft Maintenance

Leveraging Information Technology for Optimal Aircraft Maintenance, Repair and Overhaul (MRO)

This is a practical approach to, and comprehensive examination of, the problems that face the aviation supervisor. The first chapter discusses the impact of population and geographic changes on the regulation of the airline industry. Chapter 2 deals with “The Federal Aviation Administration,” Chapter 3 with “Regulatory Requirements,” and Chapter 4 with “Organizational Structures.” Chapter 5, “Management Responsibilities,” explores such practical aspects as directing programs, leadership, providing motivation and incentives, and communication. Chapter 6, “Aviation Maintenance Procedures”—Chapter 7, “Applications of Aviation Maintenance Concepts”—and Chapter 8, “Budgeting, Cost Controls, and Cost Reduction”—also explore the daily problems of aviation supervision in practical terms. Chapter 9, “Training and Professional Development in Aviation Maintenance,” contains a discussion of certified aviation maintenance technical schools. Chapter 10 is an in-depth assessment of “Safety and Maintenance.” Discussed here are safety in the maintenance hangar and on the ramp, fueling aircraft, electrical safety, radiation concerns, and building requirements. Chapter 11, “Electronic Data Processing,” covers the computer and applications of received data. Chapter 12, “Aviation Maintenance Management Problem Areas,” deals with matters ranging from parts ordering to administrative concerns. The final chapter is a “Forecast and Summary.”

Managing Safety in and Around Airports

This document reports the results of a November 1994 conference held by RAND in Amsterdam, which brought together experts and stakeholders from different countries to identify key airport safety policy challenges and to discuss possible solutions. Participants were drawn from airport authorities, carriers, manufacturers, regulators, and governmental and nongovernmental international organizations. Areas covered include defining and measuring airport safety; public perceptions; how safety is addressed in other industries; the current state of airport safety; safety developments in manufacturing, air traffic control, and flight operations; and new institutional mechanisms and requirements at the national and international levels.
