Solvent Neurotoxicity presents a comprehensive summary of the latest information available regarding acute and chronic neurotoxicity of a number of solvents. Ten solvents (Chloromethane; Dichloromethane; N-Hexane; Methyl Ethyl Ketone; Methyl N-Butyl Ketone; Styrene; Toluene; 1,1,1-Trichloroethane, Trichloroethylene, and Xylene) and two mixtures of solvents (White Spirit, Mixed solvent exposure) have been selected based on their widespread use, as well as the mounting evidence from research concerning the neurotoxicity of these particular solvents. Evidence is presented from animal and human experiments, clinical observations, and epidemiological studies. The various methods used to establish a neurological diagnosis are described as well, and the advantages and disadvantages of these methods are discussed. Researchers involved in solvent neurotoxicological studies, occupational hygiene specialists, epidemiologists, and trade unions and industries whose members and employees work with organic solvents will find this book to be essential in determining methods for preventing chronic toxic neuropathy, encephalopathy, and other solvent-related disorders.
