Clinical conformal radiotherapy is the holy grail of radiation treatment and is now becoming a reality through the combined efforts of physical scientists and engineers, who have improved the physical basis of radiotherapy, and the interest and concern of imaginative radiotherapists and radiographers. Intensity-Modulated Radiation Therapy describes in detail the physics germane to the development of a particular form of clinical conformal radiotherapy called intensity modulated radiation therapy (IMRT). IMRT has become a topic of tremendous importance in recent years and is now being seriously investigated for its potential to improve the outcome of radiation therapy. The book collates the state-of-the-art literature together with the author's personal research experience and that of colleagues in the field to produce a text suitable for new research workers, Ph.D. students, and practicing radiation physicists that require a thorough introduction to IMRT. Fully illustrated, indexed, and referenced, the book has been prepared in a form suitable for supporting a teaching course.

Exploring where & why

This book critically explores the interconnections between tourism and the contemporary city from a policy-oriented standpoint, combining tourism perspectives with discussion of urban models, issues, and challenges. Research-based analyses addressing managerial issues and evaluating policy implications are described, and a comprehensive set of case studies is presented to demonstrate practices and policies in various urban contexts. A key message is that tourism policies should be conceived as integrated urban policies that promote tourism performance as a means of fostering urban quality and the well-being of local communities, e.g., in terms of quality spaces, employment, accessibility, innovation, and learning opportunities. In addition to highlighting the significance of urban tourism in relation to key urban challenges, the book reflects on the risks and tensions associated with its development, including the rise of anti-tourism movements as a reaction to touristification, cultural commodification, and gentrification. Attention is drawn to asymmetries in the costs and benefits of the city tourism phenomenon, and the supposedly unavoidable trade-off between the interests of residents and tourists is critically questioned.

Guided Inquiry

This volume features bioarchaeological research that interrogates the human skeleton in concert with material culture,

ethnographic data and archival research. This approach provides examples of how these intersections of inquiry can be used to consider the larger social and political contexts in which people lived and the manner in which they died. Bioarchaeologists are in a unique position to develop rich interpretations of the lived experiences of skeletonized individuals. Using their skills in multiple contexts, bioarchaeologists are also situated to consider the ethical nature and inherent humanity of the research collections that have been used because they represent deceased for whom there are records identifying them. These collections have been the basis for generating basic information regarding the human skeletal transcript. Ironically though, these collections themselves have not been studied with the same degree of understanding and interpretation that is applied to archaeological collections.

This volume presents a variety of overall assessments of technology and individual descriptions of work-in-progress. Supported by private funders, non-profit organizations, government agencies, and a variety of other sources, these efforts address education programs focused on specific subject matter such as mathematics or troubleshooting of school-based learning using computers. They also focus on classes of technology such as intelligent systems, distance learning, and hypertext. Taken together, they portray the range of strategies through which we can begin to understand the impact of educational technology in the future. In addition, they illustrate different approaches currently adopted by technology designers to place and explain their work in a larger context. Each of the chapters presents a different point of entry on the technology assessment problem. Even those nominally focused on a single implementation, such as testing or teacher observation, demonstrate the clear interest by their authors in the larger implications of their work.

Medical Microbiology: The Big Picture

Blood has long been an object of intrigue for many of the world's philosophers and physicians, and references to it have existed since the earliest studies of human anatomy. Herodotus of Halicarnassus, whose writings 500 years before the birth of Christ drew on stories collected during his widespread travels, was amongst the first to identify the ritualistic and medical significance of blood. However, despite this long established history, haematology as a medical specialty is relatively new. *A History of Haematology: From Herodotus to HIV* traces the history of haematology from biblical times to the present, discussing the major defining discoveries in the specialty, ranging from war as a catalyst for the development of new techniques in blood transfusion, to the medical response to the HIV/AIDS epidemic. In this beautifully illustrated and passionately rendered history of the field of haematology, Professor Shaun McCann traces the remarkable developments within haematology and the work of the scientists and pioneers central to these advances. This engaging and authoritative history will appeal to a wide audience including haematologists, nurses and other health care workers in haematology, as well as medical students, and general physicians with an interest in haematology.

This book is the first of its kind, combining international perspectives on the current ethical considerations and challenges facing bioarchaeologists in the recovery, analysis, curation, and display of human remains. It explores how museum curators, commercial practitioners, forensic anthropologists, and bioarchaeologists deal with ethical issues pertaining to human remains in traditional and digital settings around the world. The book not only raises key ethical questions concerning the study, display, and curation of skeletal remains that bioarchaeologists must face and overcome in different countries, but also explores how this global community can work together to increase awareness of similar and, indeed, disparate ethical considerations around the world and how they can be addressed in working practices. The key aspects addressed include ethics in bioarchaeology and forensic anthropology, the excavation, curation, and display of human remains, repatriation, and new imaging techniques. As such, the book offers an ideal guide for students and practitioners in the fields of bioarchaeology, osteoarchaeology, forensic anthropology, medical anthropology, archaeology, anatomy, museum and archive studies, and philosophy, detailing how some ethical dilemmas have been addressed and which future dilemmas need to be considered.

"Southern California is home not only to the country's second largest metropolitan center but to an estimated 3,000 to 4,000 different kinds of insects. Insects of the Los Angeles Basin provides an introduction to more than 400 of the most conspicuous or curious of these invertebrate animals and to about 70 spiders, mites and ticks, and related forms. With color photographs or drawings of all but a few species, the text describes the size and most striking physical characteristics of adults and immature stages and gives information on locomotion and behavior, offensive and defensive maneuvers, mating rituals, food preferences, nests and traps, and noises and scents. The specific habitat and general geographic range of each insect are included, as are lore and superstition regarding some notorious species." "The author, Dr. Charles L. Hogue, has answered the questions that he was most often asked in his position as Curator of Entomology at the Natural History Museum of Los Angeles County. The result is a highly readable text with an emphasis on the effects that insects have on the people who encounter them."--BOOK JACKET. Title Summary field provided by Blackwell North America, Inc. Cooperative Problem-Solving Activities for Social Studies, Grades 6-12

Throughout its history, America has been defined through maps. Whether made for military strategy or urban reform, to encourage settlement or to investigate disease, maps invest information with meaning by translating it into visual form. They capture what people knew, what they thought they knew, what they hoped for, and what they feared. As such they offer unrivaled windows onto the past. In this book Susan Schulten uses maps to explore five centuries of American history, from the voyages of European discovery to the digital age. With stunning visual clarity, *A History of America in 100 Maps* showcases the power of cartography to illuminate and complicate our understanding of the past. Gathered primarily from the British Library's incomparable archives and compiled into nine chronological chapters, these one hundred full-color maps range from the iconic to the unfamiliar. Each is discussed in terms of its specific features as well as its larger historical significance in a way that conveys a fresh perspective on the past. Some of these maps were made by established cartographers, while others were made by unknown individuals such as Cherokee tribal leaders, soldiers on the front, and the first generation of girls to be formally educated. Some were tools of statecraft and diplomacy, and others were instruments of social reform or even advertising and entertainment. But when considered together, they demonstrate the

many ways that maps both reflect and influence historical change. Audacious in scope and charming in execution, this collection of one hundred full-color maps offers an imaginative and visually engaging tour of American history that will show readers a new way of navigating their own worlds.
