Resumes for Computer Professionals

One lesson of the tough employment market of the 1990s is that every job-seeker needs a resume customized to highlight his or her particular strengths in powerful and effective terms. This is particularly important for scientists and engineers, who until now have enjoyed a "buyer's" market. In this major revision of her popular resource for scientists and engineers, Adele Lewis joined forces with scientist and writer David J. Moore to show technical professionals how to prepare resumes to fit the special requirements of their professions. Whether you're targeting an entry-level job or a top management position, Best Resumes for Scientists and Engineers gives you everything you need to create the kind of standout resume technical employers are looking for, including all the basic elements that go into writing an effective resume - style, content, format, word choice, clearly defined objectives, career summaries, and more; worksheets that take you step-by-step through the resume writing process; ten powerful resume formats; more than seventy-five sample resumes for twenty-five different hi-tech industries; tips on what you should and shouldn't say in a cover letter; five simple steps that will improve your chances of landing an interview. Plus all-new information on writing a resume to target positions at every level of employment - from entry-level all the way to top management; conducting a successful technical job search in a recessionary climate; using the latest computer technologies when preparing your resume; and much more!

Devised with a focus on problem solving, Geotechnical Problem Solving bridges the gap between geotechnical and soil mechanics material covered in university Civil Engineering courses and the advanced topics required for practicing Civil, Structural and Geotechnical engineers. By giving newly qualified engineers the information needed to apply their extensive theoretical knowledge, and informing more established practitioners of the latest developments, this book enables readers to consider how to confidently approach problems having thought through the various options available. Where various competing solutions are proposed, the author systematically leads through each option, weighing up the benefits and drawbacks of each, to ensure the reader can approach and solve real-world problems in a similar manner. The scope of material covered includes a range of geotechnical topics, such as soil classification, soil stresses and strength and soil self-weight settlement. Shallow and deep foundations are analyzed, including special articles on laterally loaded piles, retaining structures including MSE and Tieback walls, slope and trench stability for natural, cut and fill slopes, geotechnical uncertainty, and geotechnical LRFD (Load and Resistance Factor Design).

The Electrician and Electrical Engineer

Journal of the Institution of Electrical Engineers

Since the introduction of recombinant human growth hormone and insulin a quarter century ago, protein therapeutics has greatly broadened the horizon of health care. Many patients suffering with life-threatening diseases or chronic dysfunctions, which were medically untreatable not long ago, can attest to the wonder these drugs have achieved. Although the first generation of protein therapeutics was produced in recombinant Escherichia coli, most recent products use mammalian cells as production hosts. Not long after the first production of recombinant proteins in E. coli, it was realized that the complex tasks of most post-translational modifications on proteins could only be efficiently carried out in mammalian cells. In the 1990s, we witnessed a rapid expansion of mammalian-cell-derived protein therapeutics, chiefly antibodies. In fact, it has been nearly a decade since the market value of mammalian-cell-derived protein therapeutics surpassed that of those produced from E. coli. A common characteristic of recent antibody products is the relatively large dose required for effective therapy, demanding larger quantities for the treatment of a given disease. This, coupled with the broadening repertoire of protein drugs, has rapidly expanded the quantity needed for clinical applications. The increasing demand for protein therapeutics has not been met exclusively by construction of new manufacturing plants and increasing total volume capacity. More importantly the productivity of cell culture processes has been driven upward by an order of magnitude in the past decade.
