"Stains develop on the surface of Indiana dimension limestone when the padding material used as spacers to stack the finished stone on pallets is exposed to prolonged periods of high moisture. these pad marks create problems for every participant in the project Improper cleaning techniques, particularly attempts to remove pad marks by abrasion, can so severely damage the limestone that the only solution is to replace the stone An investigation of how to remove these stains without damaging the finished stone surface was pursued by the Indiana Geological Survey during a 12-month study. The pad marks were treated with ten commercial products several basic household cleaning agents, and two caustic chemical compounds. Seven of the commercial products removed part or all of the pad marks and three of the household materials removed part or all of the stains. Simulating natural weather conditions was an effective way of remediating the stains." -- [p. 1].

Materials syntheses are more complex than syntheses of inorganic or organic compounds. Materials synthesis protocols often suffer from unclarities, irreproducibility, lack in detail and lack in standards. The need to change this situation is the main motivation for this book. It collects a number of detailed protocols, ranging from organic polymers to carbonaceous and ceramic materials, from gels to porous and layered materials and from powders and nanoparticles to

films.
