The second edition of this popular book presents a detailed economic analysis of professional football at club level, with new material included to reflect the development of the economics of professional football over the past ten years. Using a combination of economic reasoning and statistical and econometric analysis, the authors build upon the successes and strengths of the first edition to guide readers through the economic complexities and peculiarities of English club football. It uses a wide range of international comparisons to help emphasize both the broader relevance as well as the unique characteristics of the English experience. Topics covered include some of the most hotly debated issues currently surrounding professional football, including player salaries, the effects of management on team performance, betting on football, racial discrimination and the performance of football referees. This edition also features new chapters on the economics of international football, including the World Cup.

Guy Stewart Callendar (1898–1964) is noted for identifying, in 1938, the link between the artificial production of carbon dioxide and global warming. Today this is called the “Callendar Effect.” He was one of Britain’s leading steam and combustion engineers, a specialist in infrared physics, author of the standard reference book on the properties of steam at

high temperatures and pressures, and designer of the burners of the notable World War II airfield fog dispersal system, FIDO. He was keenly interested in weather and climate, taking measurements so accurate that they were used to correct the official temperature records of central England and collecting a series of worldwide weather data that showed an unprecedented warming trend in the first four decades of the twentieth century. He formulated a coherent theory of infrared absorption and emission by trace gases, established the nineteenth-century background concentration of carbon dioxide, and suggested that its atmospheric concentration was rising due to human activities, which was causing the climate to warm. Callendar's contributions to climatology led the way in the mid-twentieth-century transition from the traditional practice of gathering descriptive climate statistics to the new and exciting field of climate dynamics. In the first half of the twentieth century, the carbon dioxide theory of climate change had fallen out of favor with climatologists.

Ever since the first Olympic Games in Ancient Greece, sports have become an integral part of human civilization. The last decade has been commemorated by the centennial celebration of the modern Olympic movement. With great anticipation, the Olympics return to Athens, Greece, and we are once again reminded that we live in one of the most exciting periods in the history of sports. Reflecting back on my years of service as the International Olympic Committee president, I cannot overlook the remarkable changes that have taken place in the world of sports during these two decades. The technological development and consequent globalization of the world economy opened up a window of new opportunities for the sports industry. As a result, management, economics, and other sciences have become a significant part of modern sports. It is my pleasure to introduce this volume comprising an interesting collection of papers dealing with various aspects of management, economics and optimization applied to sports. May this book serve as a valuable source of information to researchers and practitioners as well as to casual readers looking for a deeper insight into the magnificent world of sports.
